IMPRESSIONS

Visual impacts often feature strongly in arguments for or against a proposed development. Arguments about whether the impacts of a development are acceptable or not can be greatly assisted by an accurate representation of those impacts. For this reason, Computer-Generated Imagery is fast becoming the standard for visual evidence, allowing an assessment authority to effectively visualise complex development proposals.

However, the value of visual evidence relies on its accuracy. Assessments based on poorly-constructed, expressive or incomplete CGI can be misleading, open to criticism and may jeopardise the success of your argument.

Enter Bold Impressions. As one of Australasia's first dedicated 3D studios, we've untangled the process of CGI visualisation to deliver unparalleled accuracy and professionalism. Our team comprises experts in business operations, engineering and architecture, giving us a significant edge in interpreting technical data.

Bold Impressions harnesses the full power of 3D technology to help you represent the potential impacts of a development, or the likely success of any measures proposed to manage the impacts, with flexibility and design integrity. We can construct a shadow analysis for any location on earth, predict weathering effects on exposed materials or demonstrate the degree to which proposed or existing landscaping could provide an effective visual screen over time.

Bold Impressions offers accurate, affordable visual services to simplify the task of assessing visual impacts and form the basis for better decisions. You'll wonder how you practised without us!
